

Product Writeup Guideline

0. The Basics

- **Product Name:**
AI Based Risk System
- **Product One-liner (< 150 words)**
An AI-driven assistant that supports SecOps teams in evaluating vulnerability risk acceptance requests through MITRE ATT&CK-based threat modelling, deployment context, and structured scoring.
- **Team Members & Respective Divisions**
VM_Busters_1: Teo Juey Hea (CSG), Chua Chong Long (CSG), Peter Kuan (CSG), Bryan Lee (CSG), Daniel Lim (CSG)
- **Cover Image:**

1. Problem Statement

- **Users:**
Service product and security support team
- **Use Case:**
Assessment officers review disclosed vulnerabilities and determine their contextualised risk, including residual risk arising from delayed patching. This process is currently conducted manually via ServiceNow and requires multiple levels of endorsement before patching decisions can be finalised.

- **Pain Point:**

Accurate vulnerability assessment requires officers to understand the affected system's architecture, its exposure, and the potential methods of exploitation. Gathering and synthesising this context manually is both laborious and time consuming.

- **Consequence:**

Without AI automation using threat modelling, contextualised risk assessments will remain slow and resource-intensive, delaying critical patching decisions and leaving systems exposed to exploitable vulnerabilities longer than necessary. The manual process also creates a bottleneck that hampers timely responses to emerging threats.

2. User Research and Market Analysis

- **User Research:**

Conduct interviews with assessment officers asking about their current workflow, pain points, and time spent per assessment

- **De-risking:**

Speed and accuracy

- **Stakeholder Buy-in:** Service product and security support teams

3. Solutioning

- **Problem-Solution Fit:**

The product automatically ingests vulnerability announcements and applies AI-powered threat modelling and system architecture review to cross-reference them against known exposure data, producing a contextualised risk assessment ready for the officer's review and endorsement.

- **Functionality:**

When a vulnerability is announced → the system ingests it and auto analyses affected systems and exposure → it generates a risk assessment with recommended action → the officer reviews and endorses the decisions.

- **User Experience:**

Simplify the process and improve the accuracy of the product's outputs.

- **User Validation:** Haven't conduct any user testing with prototype at this point

4. Impact & Next Steps

- **Success Metrics:**

A high volume of vulnerability assessments completed through the platform strongly indicates that officers have embraced AI-driven threat modelling capabilities and incorporated it into their workflow.

- **Expected Impact:**

To run a pilot programme with a select group of 5–10 assessment officers, with a targeted outcome of reducing the time spent per vulnerability assessment by 50%, demonstrating the platform's efficiency gains
