

Setup Guide: Cloud-Native Development Environment

1. Overview

This guide covers setting up your **VMS Risk System** project for cross-machine synchronization using **GitHub** (for source code) and **Google Drive via Rclone** (for encrypted history).

2. Prerequisites

- ☒ Docker installed and running.
- ☒ Rclone installed (`curl https://rclone.org/install.sh | sudo bash`).
- ☒ Git installed.
- ☒ GitHub account and Google Drive access.

3. GitHub Initialization (Logic)

Run these commands in your `vms-risk-system/` directory:

```
git init
git add .
git commit -m "Initialize project structure with Docker support"
git remote add origin <your-repo-url>
git branch -M main
git push -u origin main
```

4. Google Drive Configuration (Data)

1. Run: `rclone config`
2. Follow prompts:
 - **Name:** remote
 - **Storage:** drive (Google Drive)
 - **Scope:** 1 (Full access)
 - **Auto Config:** y (Follow browser auth)
3. Create the remote directory: `rclone mkdir remote:vms-vault`

5. First-Time Synchronization

To push your state to the cloud:

```
# Push Code
git push -u origin main

# Push Encrypted Vault
rclone sync ../vms-vault/cipher remote:vms-vault/cipher
```

6. Daily Workflow

On any machine: 1. `./setup_docker.sh` (Initial setup) 2. `./sync.sh` (Pulls latest code and vault) 3. `docker-compose up` (Start environment)
